

How to Use This Website

1. Introduction

This web application is a Cloud Security Monitoring System designed to help security analysts and administrators identify suspicious activity, manage alerts, and monitor cloud security events. It supports role-based access control and provides a unified dashboard for real-time threat visibility.

2. Main Features and How to Use Them

Use the website following the steps below to access its core capabilities.

2.1 Sign In

Access the application through your browser and sign in using your assigned credentials. The login page accepts your username and password, then directs you to the dashboard appropriate for your role.

2.2 Dashboard

The dashboard is the central hub for monitoring cloud security activity. It typically shows:

- Total and open alerts
- Critical alert counts
- Recent security events and login activity
- Trend data for the last 7 days

Review these metrics first to understand the current security posture and identify urgent issues.

2.3 Alerts

Navigate to the Alerts section to view, acknowledge, and resolve security alerts. Alerts may be categorized by severity and status. Use the available filters to focus on open or critical items.

Key actions:

- Open an alert to see details and associated events
- Acknowledge alerts to mark them as reviewed
- Resolve alerts when the incident has been addressed

2.4 Events

The Events section contains detected security incidents and anomalies. Each event includes metadata such as event type, severity, source IP, and time. Use this view to investigate patterns and identify the root cause of alerts.

2.5 Reports

Reports provide analytics and summaries of the security landscape. Use reports to track event distribution, resolution rate, and other long-term metrics. This section is useful for reviewing trends and preparing summaries for stakeholders.

2.6 Admin Tools

If you have admin permissions, use the Admin pages to manage users and view audit logs. User management allows you to create, edit, and activate accounts, while audit logs show administrative actions

and activity history.

3. Tips for Best Results

- Review the dashboard daily to catch early warning signs.
- Sort alerts by severity and respond to critical issues first.
- Use event details to verify true positives before resolving alerts.
- Keep user roles updated so each account has the correct access level.
- Use audit logs to confirm that changes and actions are tracked properly.

4. Troubleshooting and FAQ

Common questions and solutions:

- I cannot log in. Verify your username and password and confirm your account is active. If account lockout is configured, wait or contact an administrator.
- I do not see the Alerts section. Ensure you are logged in with an analyst or admin role; viewers may have limited access.
- An alert is not updating. Refresh the page and confirm your session is active; use the API summary if available to verify backend alert counts.
- I need to add users. Use the Admin > User Management page if you have admin rights, then assign the correct role and set an initial password.
- The dashboard looks blank or broken. Clear browser cache, reload the page, and verify the server is running at the correct local address.

5. Support

For technical issues, check the server logs, validate the environment configuration, and ensure the database is accessible. If you need further assistance, contact the project maintainer or administrator for support.
